

## Assignment Title

### Configure an AWS Application Load Balancer (ALB) Using Path-Based Routing

#### Objective

Design and deploy a highly available web application architecture using an AWS Application Load Balancer (ALB). The ALB must route incoming requests to different target groups based on the URL path. Each target group must contain at least two backend web servers.

#### Scenario

Your organization hosts two web applications:

- **Application 1** accessible through `/app1`
- **Application 2** accessible through `/app2`

Users should access both applications through a single ALB endpoint, and the ALB should route traffic to the correct target group based on the path entered in the browser.

Check for html code in teams for app1 & app2

Note: Use only the html code provided for this lab in teams make sure to download it.

**Submission Format:** PDF report containing all screenshots, configuration steps, and testing results.

Good Luck!!!
